config parser

Config Parser

config parser是一個可以幫你快速解析config的工具包

我先創建一個app.ini

```
[DEFAULT]
# default是共用區間
version = 2.0
path = /User

[TEST]
path = /User/Documents

[www.google.com]
# 利用getboolean, yes:True, no: False
google = yes
# 可以取別的section的值
googlepath = ${path}/Elwing
googlepath2 = ${TEST:path}/Elwing
```

In [1]:

```python
import configparser
# ExtendedInterpolation() 會改用 $ 符號來做parsing
config = configparser.ConfigParser(interpolation=configparser.ExtendedInterpolation())
config.read("app.ini", encoding="utf-8")

print(config.sections())
print(config["www.google.com"].get("version"))
print(config["www.google.com"].get("googlepath"))
print(config["www.google.com"].get("googlepath2"))

print(config["www.google.com"].getboolean("google"))
```

```
['TEST', 'www.google.com']
2.0
/User/Elwing
/User/Documents/Elwing
True
```
